Subject: **Miami Urban Area
Transportation Study**

Dear Jose:

Enclosed are five copies of the Technical Memorandum entitled Directional Trip Distribution, for the subject study.

Please let me know if you should have any questions or comments.

Very truly yours,

GANNETT FLEMING TRANSPORTATION ENGINEERS, INC.

Myung H. Sung
Director, Technical Services

DIRECTIONAL TRIP DISTRIBUTION PROGRAM 1

PROGRAM APPLICATION 2

APPENDIX A Program and Controls

APPENDIX B Year 1986 Simulation

APPENDIX C Year 2010 Simulation

INTRODUCTION

This memorandum describes the computer program developed and assumptions used to produce directional trip distribution from a zone. The computer program was designed to provide a summary of the daily vehicle trips to the eight cardinal directions for each of the 1,089 internal zones within the Miami urban area. The summary generated by the program will provide an estimate of travel by direction for each individual zone using a sketch planning technique described below.

DIRECTIONAL TRIP DISTRIBUTION PROGRAM

The directional trip distribution program was structured to interface directly with the Miami mainframe model chain. The Miami model was developed with the Urban Transportation Planning System (UTPS) software. The directional trip distribution program was developed as a FORTRAN subroutine to the UTPS UMODEL program. UMODEL provides the option of coding "user-specific" FORTRAN routines which can be used to access standard UTPS input and output files directly. This compatibility ensures a simplified process which can be executed as part of a Miami mainframe model. Input required by the program is contained in two files. The first file, commonly referred to as the "XY" or coordinate file, includes coordinates which describe the location of each zonal centroid. The second file contains a matrix of the daily vehicle trips created after the modal split step in the Miami model chain. This file is referred to as the "HTAB" or highway trip table file. The vehicle trips in this file are in a balanced or "origin-destination" format which ensures that the amount of daily trips moving in both directions between a given pair of zones are equal.

The program is designed to identify the direction of travel from each internal zone to all possible destination zones. Trips associated with each of the zonal pairs are assigned to one of the eight cardinal directions. Each of the cardinal directions consists of a 45 degree angle formed by the intersection of the eight major compass bearings and are defined as follows:

- NNE - between North and Northeast
- ENE - between East and Northeast
- ESE - between East and Southeast
- SSE - between South and Southeast
- SSW - between South and Southwest
- WSW - between West and Southwest
- WNW - between West and Northwest
- NNW - between North and Northwest

The direction of each zonal pair (interchange) is defined based upon the differences in x and y coordinates for the each interchange, using the origin zone as a reference point. Once the directions of each interchange are determined, daily vehicle trips from the Miami model chain are assigned to the directions. The program then summarizes the number of trips and the percentage by direction and by origin zone. UMODEL subroutine developed for the process and controls required to run the program are included in Appendix A.

It should be noted to the user of this program that the directions of travel from a given zone to all other zones are determined only by their centroid locations. The program does not consider the actual path of travel to determine the directions of trips. Output should be used considering this limitation of the program.

It should also be noted that the program calculates only the direction of trips originating from a given zone. Hence, the summary includes the "one-way" daily vehicle trips leaving the zone but not the trips entering the zone. To calculate trips to and from a particular zone the values for the eight cardinal directions must be multiplied by a factor of two. However, percentages should remain the same.

PROGRAM APPLICATION

Two production runs were made using the program developed. These are Year 1986 simulation and Year 2010 simulation with Existing and Committed (E+C) network. The outputs of these computer runs are included in Appendices B and C.
